

# Product: UTD Sites

## Major Changes:

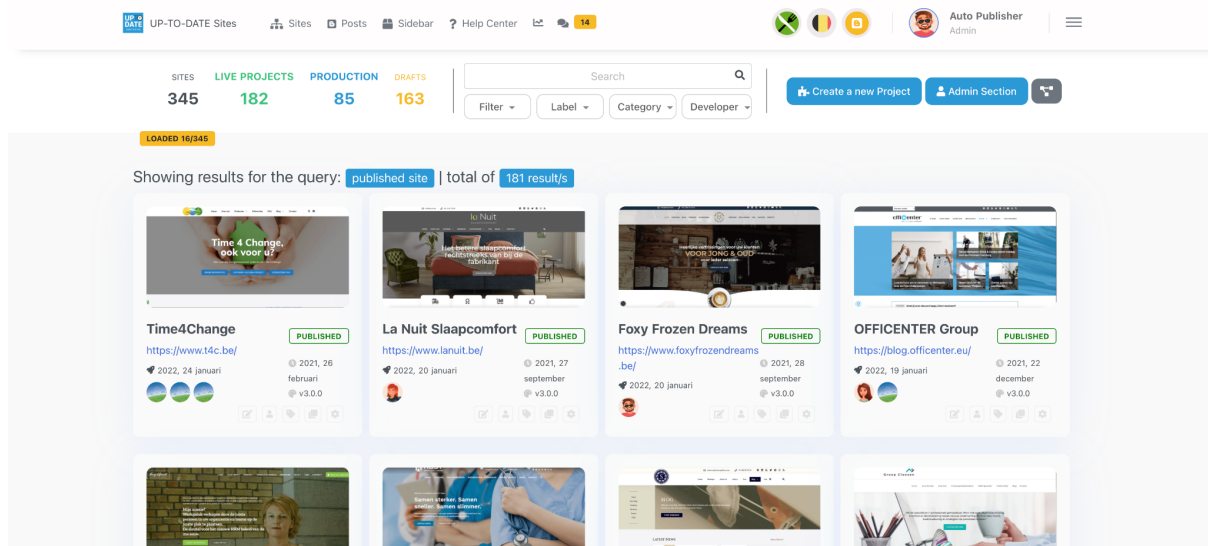

1. Better way of handling heavy images
  - Changes with the API to handle heavy images uploaded by the user. If the user uploaded heavy images ranging from 3-10mb per image, it will scale it down to 200-500kb by scaling the resolution max to 1920px.
2. Added new privacy cookies

### 3. Changes with the search

The search was not that good before, now it can do more. We can see all the **labels** used in the site, all the **categories** assigned, and **developer** who is working with the site. Search is also happening directly to the database, not only on the loaded data.

- Added categories, developer, and improve label in the search.
- Query directly on the database and not in the loaded page.
- Expand the options in the settings modal of the card to add label, developer and category.

#### Minor Changes:

- Show <https://www.uptodateconnect.com/cookies-disabled> if not disabled.
- Installed tracking in user's activity to get historical data

### In progress:

- Ability to create versions of the site
- Visuals changes when publishing to blogger

### Bug fixes:

- gallery not rendering correctly in site
- Paragraph gone after editing via the edit button when link or bold is in the text, now it is fixed. We can now use it to edit text again in the tablet.
